

TL;DR: The job description outlines a high-impact, hybrid role combining Technical Product Management with AI evangelism and low-code prototyping. The core mission is to scale AI tool adoption within the Vehicle Electrical, Software, and Systems Engineering (VESSE) ecosystem to accelerate vehicle development.

Role Overview & Mission

- **Position:** Technical Product Manager – VESSE Ecosystem of AI Tools
- **Level:** Senior Associate (3 to 5 years of relevant experience)
- **Education:** Bachelor's Degree required
- **Work Setup:** Hybrid (4 days onsite, 1 day remote); requires in-person interviews

Core Mission: Act as a technical practitioner and internal evangelist to lead the strategy, rapid prototyping, and adoption of AI solutions that accelerate the design, development, and validation of vehicle electrical and software systems.

Key Responsibilities

1. Ecosystem Strategy & Evangelism

- **Portfolio Advocacy:** Serve as the lead "product champion" for the existing VESSE AI tool suite to drive high adoption among electrical, software, and systems engineers.
- **Feature Discovery:** Embed deeply within engineering workflows to identify pain points and translate them into actionable features for the AI tool ecosystem.
- **Community Building:** Lead workshops, AMA sessions, and internal demonstrations to showcase how the AI ecosystem solves engineering bottlenecks.

2. Rapid POC Development (Low-Code/No-Code)

- **Hands-on Prototyping:** Utilize LCNC platforms (e.g., Streamlit, GitHub Copilot extensions, Claude Agent mode, ChatGPT, Gemini) to build functional, "quick-win" Proofs of Concept (POCs).
- **Feasibility Testing:** Validate technical feasibility and user desirability through prototyping before committing full-scale engineering resources.

3. Business Case & KPI Ownership

- **Value Quantification:** Build robust business cases linking technical performance to VESSE-specific metrics:
 - Engineering Hours Saved
 - Defect Detection Rate (DDR)
 - Time-to-Market reduction
 - System Reliability
- **ROI Tracking:** Monitor the impact of the AI tool ecosystem on the vehicle development lifecycle and report progress directly to executive leadership.

4. Technical Integration & Lifecycle Management

- **Domain Integration:** Ensure AI tools are deeply integrated with standard workflows, including SysML, AUTOSAR, Model-Based Systems Engineering (MBSE) tools, and CI/CD pipelines.
- **Data Strategy:** Partner with data engineers to ensure access to high-quality, labeled engineering data for model training and fine-tuning.

Requirements & Competencies

Required Skills & Experience

- **Domain Knowledge:** Over 5 years of experience in Vehicle Electrical, Software, or Systems Engineering. Strong understanding of E/E architectures, ECU communication (CAN/Ethernet), and software-defined vehicle concepts.
- **Product Management:** Technical PM proficiency with strong Jira experience. Ability to translate business needs into actionable requirements.
- **Cross-Functional Collaboration:** Proven ability to work closely with full-stack developers, data engineers, and API developers.
- **AI & Innovation:** Strong proactive mindset with a keen interest in learning and applying AI concepts to improve products and processes.

Nice-to-Have & Preferred Skills

- **Technical Breadth:** Conceptual understanding of Big Data, Data Science, Analysis, Full Stack, and Artificial Intelligence & Expert Systems.
- **Lifecycle Familiarity:** Experience taking applications into production, productization, and end-to-end project delivery.
- *Note: No hands-on coding or UI/UX development experience is strictly required, though low-code prototyping is core to the day-to-day role.*
